

React Day 13

Making of JSON server API

Install JSON Server

- `npm install -g json-server@0.17.4 # NPM`
- `yarn global add json-server@0.17.4 # Yarn`
- `pnpm add -g json-server@0.17.4 # PNPM`

Create a db.json file with some data

```
{  
  "posts": [  
    { "id": 1, "title": "json-server", "author": "typicode" },  
  ],  
  "comments": [  
    { "id": 1, "body": "some comment", "postId": 1 },  
  ],  
  "profile": { "name": "typicode" },  
}
```

Start JSON Server

```
json-server --watch db.json
```

Now if you go to <http://localhost:3000/posts/1>,

RegEx (Regular Expression) is a pattern used to match character combinations in strings – it's like a rule to find, validate, or replace content in text.

 Common Use Cases

- Validating emails, passwords, phone numbers, etc.
- Finding specific patterns in text (like hashtags, dates, etc.).
- Replacing or splitting strings.

```
/^(?=.*[a-z])(?=.*[A-Z])(?=.*\d)(?=.*[@#$$%^&+=!]).{6,}$/
```

Part	Meaning
^	Start of string
(?=.*[a-z])	Must have at least one lowercase letter
(?=.*[A-Z])	Must have at least one uppercase letter
(?=.*\d)	Must have at least one digit (0–9)
(?=.*[@#\$\$%^&+=!])	Must have one special character
.{6,}	Minimum of 6 characters total
\$	End of string

 It's called a **lookahead** pattern: (?!...) means “must contain... somewhere in the string”.
