

React Day 4

check code in Project section

Today we have learned about

- user variable with jsx
- condition inside jsx
- user function with jsx
- operations inside jsx
- object and array with jsx
- html tags property with jsx

- diff between the js function call and react function call

• Feature	• JavaScript Function Call	• React Function (Component) Call
• 📄 What is it?	• A normal function execution	• A function that returns JSX (Component)
• 🎯 Purpose	• To perform logic/calculation	• To render UI elements
• 🚀 How to call it	• functionName()	• <ComponentName />
• 🧩 Example	• sum(2, 3)	• <Intro />
• 🔄 React Rendering	• Not applicable	• Component gets rendered in the DOM
• ✅ Can return JSX?	• Yes, but will not render it automatically	• Yes, it renders automatically
• 🔄 Runs once or on event	• Runs when explicitly called	• Runs when React renders the component

interview question

- jab hum function call karte hai to automatic calling kyu hoti hai ???

- func ki defination pass karni hoti hai calling nahi karni padti
-

```
function callMe(){
  alert("Outer function call");
}

function Que(){

  function callMe(){
    alert("inner function call");
  }

  return (
    <div>
      <button onClick={callMe}>Function Testing</button>
    </div>
  )
}

export default Que;
```

What Happened:

When the inner function exists:

- The onClick handler looks for callMe **inside the Que component first**.
- React follows **JavaScript scoping rules**:
 - Closest (local) function wins.
- So **the inner function gets called**.

When you comment the inner function:

- Now, React can't find callMe inside the component.
- It **looks outside** (global scope) and finds the outer function.
- So **the outer function gets called**.

🔥 Why?

This is JavaScript's lexical scoping:

"When a function is executed, it looks for the variable/function declaration in the nearest scope first (inside the component), then goes outward."

-
- The ^ symbol means "**compatible with version**".
 - "^19.1.0" means:
 - The minimum version allowed is 19.1.0.
 - The maximum version allowed is **less than** 20.0.0.

In detail:

- ^19.1.0 allows updates that do not change the **first non-zero digit** (the major version).
- It accepts:
 - 19.1.0
 - 19.2.0
 - 19.5.3
- It does **not** accept:
 - 20.0.0 or above (since the major version has changed).
