

React Day 5

State

```
import React from 'react'

const App = () => {

  let fruit = "apple"
  const handleFruit={()=>{
    fruit = "banana";
  }}

  return (
    <div>
      <p>{fruit}</p>
      <button onClick={handleFruit}>Fruit</button>
    </div>
  )
}

export default App
```

- In this code we see that after clicking button the name of the fruit should be changed, but this is not possible because in react just changing the variable (like fruit = "banana") does not trigger a re-render.
- re-render hone ka baad value change hoga simple.....heheheheh
- Even though the variable name changes but the react has no idea that something is changed or not, so it doesn't re-render the component.
- **Solution → react only re-render and updates the UI only when the state or props change. changing a normal variable will not trigger a re-render, that's why the updated fruit name is not visible. so we have to use state.**

what is state ?

→

- jaise ki variable ek container hote hai same container bhi ek variable hote hai jaha hum data store kr sakte hai
- this is mutable and dynamic
- we have to import it when we have to use it
- it re-render the component automatically so that data change can be visible on UI

Hooks

Now the problem is what is hooks and what's the state ??

- we have to clarify that the state are nothing but the variable that stores data.
- the hooks are the tools that manage the state that we have to import

- **State = Data.**
- **Hook = Tool to manage data or lifecycle in React.**

1. `const [fruit, setFruit] = useState("apple");`
 2. `useState` → Hook (function provided by React)
 3. `fruit` → State (the actual data)
-

```
import React from 'react'
import './App.css'
import { useState } from 'react'

const App = () => {

  const [count, setCount] = useState(0);
  const increaseCount=()=>{
    setCount(count+1);
  }

  return (
    <div className='root'>
      <p>{count}</p>
      <button onClick={increaseCount}>Click</button>
    </div>
  )
}

export default App
```

This is a simple Counter app, where the count is increase after clicking button.
